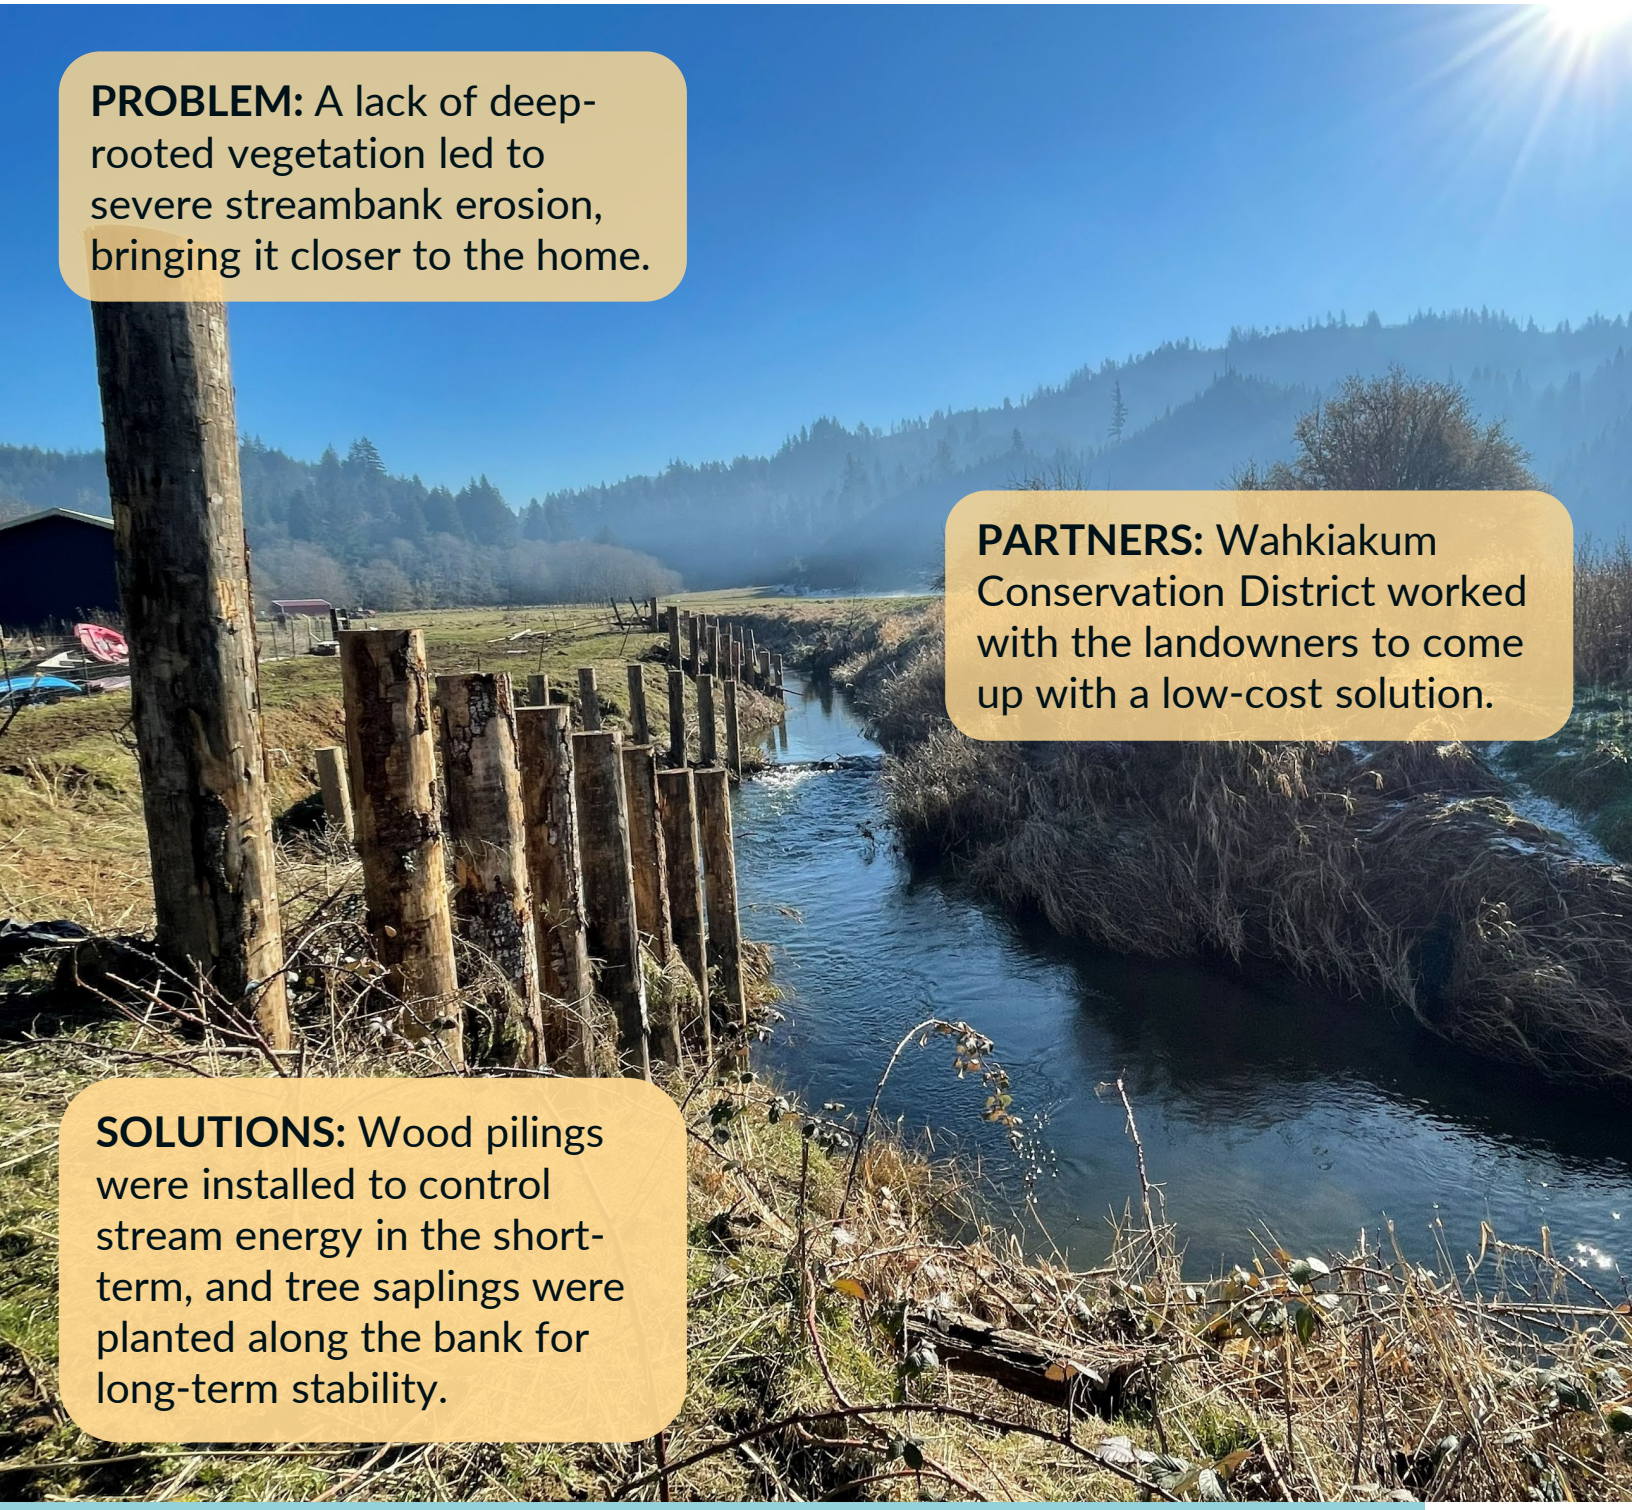
WAHKIAKUM COMMON GROUND

Success Story: Wilson Creek

The creek was eroding, threatening a house and pasture. With funding from the state and expertise from the local Conservation District, landowners were able to install a simple solution to slow erosion and enhance fish habitat.



PROBLEM: A lack of deep-rooted vegetation led to severe streambank erosion, bringing it closer to the home.

PARTNERS: Wahkiakum Conservation District worked with the landowners to come up with a low-cost solution.

SOLUTIONS: Wood pilings were installed to control stream energy in the short-term, and tree saplings were planted along the bank for long-term stability.

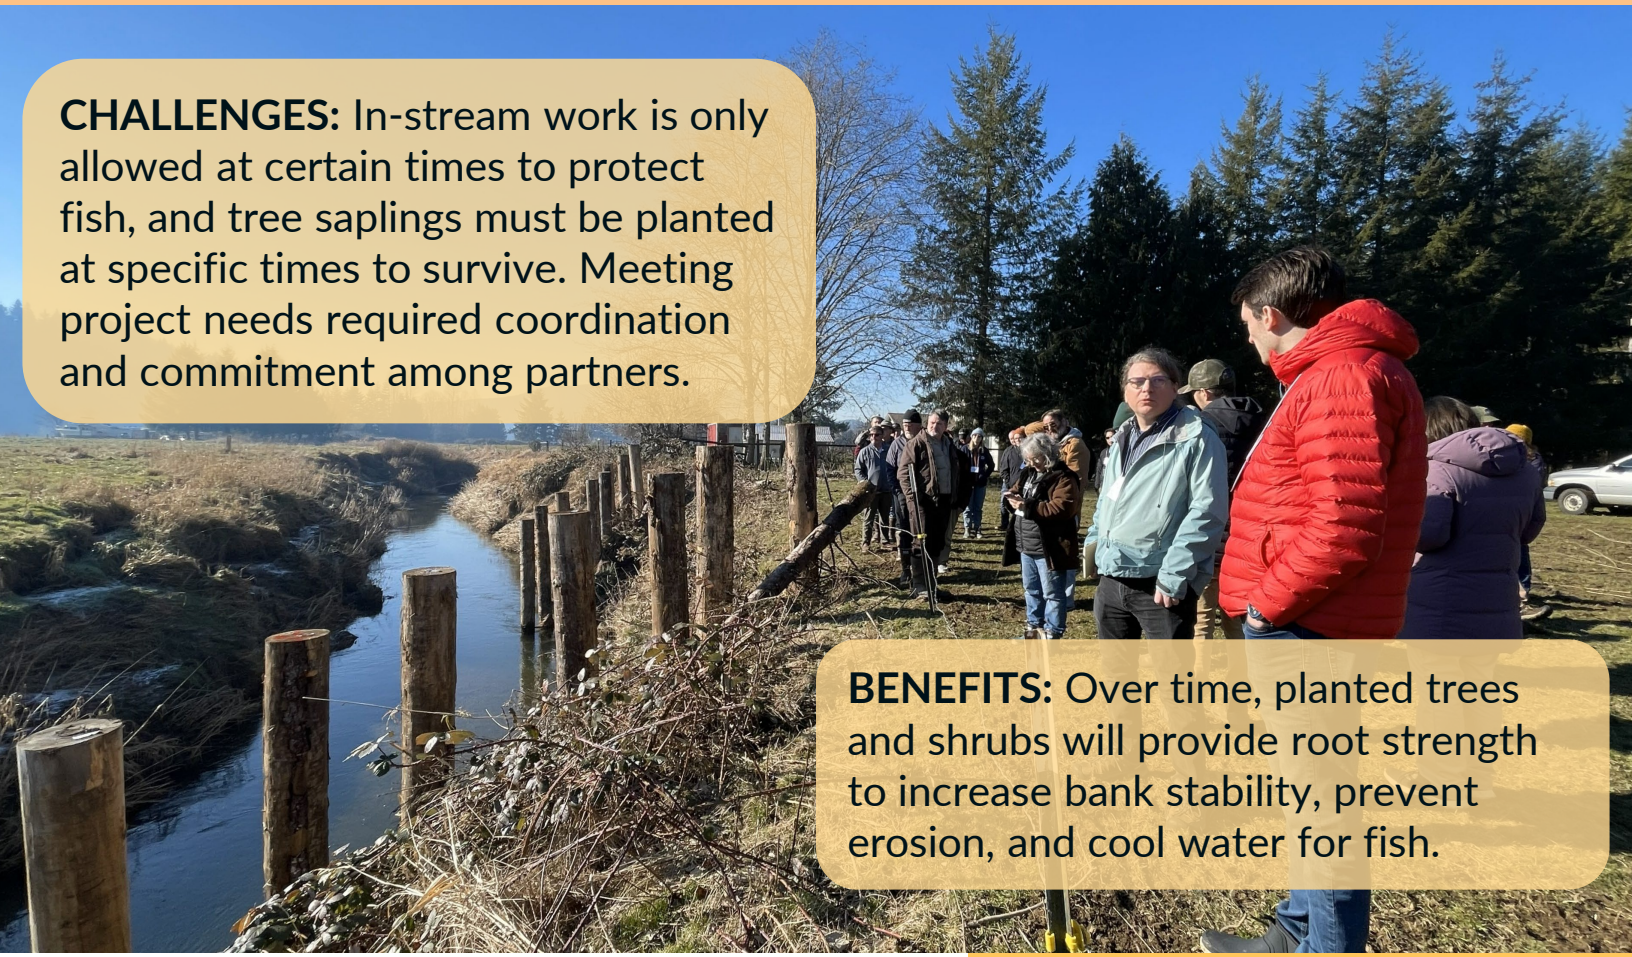
WAHKIAKUM COMMON GROUND

Success Story: Wilson Creek



CHALLENGES: In-stream work is only allowed at certain times to protect fish, and tree saplings must be planted at specific times to survive. Meeting project needs required coordination and commitment among partners.

BENEFITS: Over time, planted trees and shrubs will provide root strength to increase bank stability, prevent erosion, and cool water for fish.

LESSONS LEARNED

The landowners' home was protected, showing how simple, low-cost methods can be effective. Adaptive projects can include both short- and long-term solutions: wood pilings for short-term stream control, and planting for permanent root systems and long-term erosion protection.

***Wahkiakum County** relies on a healthy salmon fishery for commercial, tribal, and recreational purposes, yet salmon populations are threatened. Efforts to support sustainable fisheries by restoring watersheds also have benefits for the community: reducing risk from coastal hazards, boosting economic vitality, and improving emergency preparedness.*
